Project Details

Project Type: Mobile application
Status: ACCEPTED

Project Summary

CodeVista is a modern software development platform that enables businesses and individuals to request, track, and manage custom software projects from a single dashboard. It provides a seamless workflow from project inquiry to project delivery, integrating client management, project tracking, authentication, and administrative controls into one system.

Goals

The platform consists of two major modules:

User Portal – Users can register, log in securely, submit Software Requirement Specification (SRS) requests, track the status of their requests, view accepted projects, monitor development progress, manage their profile, and communicate with the development team.

Admin Portal – Administrators can manage users, review and approve/reject SRS requests, create projects from approved requests, assign project details, update project milestones, monitor user activity, and oversee the complete project lifecycle.

Target Audience

Key Features

Secure authentication with email verification and password reset.

SRS request submission with document upload support.

Admin approval workflow for project requests.

Automatic project creation after SRS approval.

User dashboard displaying:

Accepted projects

Project progress

Milestones and deadlines

Project statistics
Admin dashboard with analytics and management tools.
Real-time project status updates.
Responsive and modern UI for desktop and mobile devices.
RESTful API architecture with role-based access control.
Email notifications for important project events.

Features & Requirements

User creates an account and logs in.
User submits an SRS request describing the project requirements.
Admin reviews the submitted request.
If approved, a project is automatically created.
The project appears in the user's dashboard.
Admin updates milestones and project progress.
Users can monitor development progress in real time until project completion.

User Roles

admin user ,project Manager

Integrations

Google Maps and etc

Technology Stack

Frontend

React.js
React Router
Tailwind CSS
Axios
Lucide React Icons

Backend

Node.js
Express.js
MongoDB with Mongoose
JWT Authentication
bcrypt
Multer (File Uploads)
Resend (Email Service)

Deployment

Frontend: Vercel
Backend: Render
Database: MongoDB Atlas

Timeline

4

Budget

5-10 lakhs
